

## Panhypopituitarism and Bifid Uvula

Pankaj Singhania and Aditya Deshpande

Department of Endocrinology and Metabolism,  
Institute of Post Graduate Medical Education and Research – Seth Sukhlal Karnani Memorial Hospital, West Bengal, India

**Key words:** bifid uvula, hypopituitarism, midline defect

A 20-year-old Indian male presented with abnormal thyroid function tests and poor development of secondary sexual characteristics. Perinatal history included breech delivery, delayed cry and lower respiratory tract infection. Developmental delays, below average scholastic performance and note of being the shortest child in class were reported.

Examination revealed lack of facial hair, depressed nasal bridge, low set ears, nasal speech, short stature, increased arm span, bifid uvula (Figure 1), sparse axillary and pubic hair (A0 P1), low testicular volume and short phallic length. Combined pituitary hormone deficiency was suspected.

Laboratories show low FT4 (0.62 ng/dl) with normal TSH (3.21 mIU/mL), low levels of 8AM testosterone (<20 ng/dl), LH (0.384 U/L), FSH (0.201 U/L), 8AM cortisol (<1 mcg/dl), serum IGF1 (<20 ng/ml) and repeat FT4 (0.609 ng/dl). Serum calcium, phosphorus, and vitamin D levels were normal.

Radiographs showed scoliosis and 11.5–12.5 years bone age. Hypoplastic anterior pituitary with eutopic posterior pituitary bright spot (Figure 2) were appreciated on MRI.

Following guidelines for hypopituitarism,<sup>1</sup> he was given hydrocortisone, levothyroxine and monthly parenteral testosterone. At follow up, he reported improved sense of well-being, decreased fatigability and increased strength with noted progression of pubertal development (A0P3).

Since the hypothalamus, pituitary gland, and oral cavity develop very closely during early embryonic life, defects in one may herald abnormalities in others. Midline defects such as a bifid uvula, has been associated with hypopituitarism.<sup>2</sup> Breech delivery has also been shown to be associated with hypopituitarism.<sup>3</sup> The presence of midline defects along with other risk factors for hypopituitarism should alert physicians to the possibility of pituitary defects to facilitate earlier evaluation and intervention.

**Figure 1.** Bifid uvula.

**Figure 2.** MRI pituitary (A) sagittal view, (B) coronal view showing hypoplastic anterior pituitary (yellow arrow) with eutopic posterior pituitary.

#### Ethical Consideration

Patient consent was obtained before submission of the manuscript.

#### Statement of Authorship

Both authors certified fulfilment of ICMJE authorship criteria.

#### CRedit Author Statement

**PS:** Conceptualization, Software, Formal analysis, Resources, Data curation. Writing – review and editing, Supervision, Funding acquisition. **AD:** Conceptualization, Methodology, Validation, Investigation, Writing – original draft preparation, Visualization, Project administration.

#### Author Disclosure

Both authors declared no conflict of interest.

#### Funding Source

None.

Authors are required to accomplish, sign and submit scanned copies of the JAFES Author Form consisting of: (1) Authorship Certification, that authors contributed substantially to the work, that the manuscript has been read and approved by all authors, and that the requirements for authorship have been met by each author; (2) the Author Declaration, that the article represents original material that is not being considered for publication or has not been published or accepted for publication elsewhere, that the article does not infringe or violate any copyrights or intellectual property rights, and that no references have been made to predatory/suspected predatory journals; (3) the Author Contribution Disclosure, which lists the specific contributions of authors; (4) the Author Publishing Agreement which retains author copyright, grants publishing and distribution rights to JAFES, and allows JAFES to apply and enforce an Attribution-Non-Commercial Creative Commons user license; and (5) the Conversion to Visual Abstracts (\*optional for original articles only) to improve dissemination to practitioners and lay readers. Authors are also required to accomplish, sign, and submit the signed ICMJE form for Disclosure of Potential Conflicts of Interest. For original articles, authors are required to submit a scanned copy of the Ethics Review Approval of their research as well as registration in trial registries as appropriate. For manuscripts reporting data from studies involving animals, authors are required to submit a scanned copy of the Institutional Animal Care and Use Committee approval. For Case Reports or Series, and Images in Endocrinology, consent forms, are required for the publication of information about patients; otherwise, appropriate ethical clearance has been obtained from the institutional review board. Articles and any other material published in the JAFES represent the work of the author(s) and should not be construed to reflect the opinions of the Editors or the Publisher.
